The CSB is contracting an expert to complete 3-D mapping of the facility. CSB is aiming to complete their investigation on-Site by February 14.

The RP received a permit from WVDOH to excavate in the ditch area between the abandoned railroad and Barlow Road. CEC is drafting a plan for this operation.

The water gage level and discharge rate in the Elk River continues to decrease. While maintaining the boom located along the facility's shoreline, Clean Harbors discovered a brown mass in the river which floated to the surface. The mass had no MCHM odor. A sample was collected from the mass.

The flow rate of the off-Site water into the containment area continues to decrease; Diversified estimates

the flow at 5 gallons per minute. A crew remains on Site to oversee water pumping operations where required.
